

ABSTRACT OF THE DISCLOSURE

A child's toy caddy for use with a conveyance such as a bicycle, tricycle, or scooter, has a miniscule seat some five inches wide by four inches deep, to bar use by humans. It has a pair of handles permitting drop-on attachment to the handlebars of the conveyance, so that a child's toy such as a doll, teddy bear, raptor or like favoured toy can be strapped into the seat of the caddy, and safely transported by the child while at play with the conveyance. The caddy includes a seat pommel and safety harness with safety belt and shoulder strap, enabling a child to secure its toy to the caddy, with safe transportation for the toy, and safe use by the child of the conveyance. The caddy handles are sized to readily accommodate the brake cables of a bicycle. The caddy can be used with other environments such as a fence or seat-back, solely to accommodate a toy.
